CS6116 Assignment 2 Readme

Functionality

To begin this assignment, I ensured that the cells in Chef Table View Controller could be deleted. The code was taken from old labs from this module and examples on canvas. I began by adding the FRC to fetch the entities from the Core Data. The 'frc.performFetch()' is run to fetch the data and store it in the FRC. The 'controllerDidChangeContent' function reloads all of the table elements after they have all been deleted and the user enters the app again. The 'if editingStyle == .delete' conditional is what makes the user able to delete a cell if they want to. If the user deletes a cell, leaves the app and returns, the cell will still be deleted, due to the 'try context.save()'. The destination controller calls 'chefManagedObject', which is defined as 'CD_Chef!', so that the next view controller will draw from the core data. This was done in each destination controller for each view controller in order to prevent crashing when running that app and clicking to the next screen.

Design Elements

This assignment required me to make two new view controllers: a "NewChefViewController" to add new people to the table, and "FavTableViewController" which was my favourites list. For the NewChefViewController, I created text fields for the user to input data for their new chef, as well as paste a website URL for the web view, and a URL for a youtube video that can be watched in DetailsViewController. These variables were defined as strings in CD_Chef and the entities were created. Both new view controllers maintain the same colour palette as assignment 1, keeping the accent color of dark purple that is defined in my assets. In NewChefViewController, I made the buttons a lighter shade of purple to maintain an aesthetically pleasing design. The text fields were given a placeholder (e.g. "name here"), guiding the viewer's eye, instructing them how to use the app, and maintaining a clean design. The code for this page, including the image picker was found in the 'noCoreDataToCoreData' example on canvas. FavTableViewController was created by making another table view controller and copying and pasting the same code as ChefTableViewController. This was done to have the FRC fetch the core data, but I commented out "else" code in this conditional statement "**if** frc.sections![0].numberOfObjects > 0", so that the cells did not duplicate in ChefTableViewController.

Personal Technical Contributions

For the favourites list, I added a switch in ChefViewController, to toggle whether the chef was added to the favourites list or not. I had a label beside it "favlabel" to let the user know what they have toggled. This was highlighted in yellow to guide the viewer's eye. Originally, toggling the switch only changed the text in the label: "Click to add to favourites". The code to manipulate

the switch's action was found in lab 3 of this module. In order to add the favourited chefs to FavTableViewController, I knew further action was required. Upon looking at the previous labs, I discovered sorters and predicates, and that predicates would be required to filter the favourited chefs from the core data into the FavTableViewController. I learned how to use predicates properly from studying the youtube video '*Core Data - 14 - Filtering Results of a Fetch Request Using a Predicate in UIKit and AppKit*' by user Joshua Root - Development for All: https://www.youtube.com/watch?v=MXF4DP_ITmE. Since predicates draw from core data, I knew I had to define favorites as a boolean in my CD_Chef. I learned how to do this in stack overflow:
https://stackoverflow.com/questions/42622638/how-to-represent-core-data-optional-scalars-bool-int-double-float-in-swift.
I then completed these steps, by creating the entity 'favorite' and setting it as a boolean, as well as defining it as a boolean in my core data '**@NSManaged public var** favorite: Bool'. In my chefViewController, I set the switch's state to 'off' in the Attributes Inspector, so as not to confuse the app upon running. The user can now choose a chef, toggle it to be a favourite, and they will find this chef in the favorites table.
